Research Summary

An electrostatic chuck is a device used in semiconductor manufacturing processes to hold and immobilize wafers during various fabrication steps. It consists of a conductive base and an insulating layer, typically made of ceramic or quartz, with a patterned electrode embedded within. By applying a high voltage to the electrode, an electrostatic force is generated, creating an attractive force between the chuck and the wafer. This force securely holds the wafer in place without the need for mechanical clamping, allowing for precise positioning and alignment during processes such as etching, deposition, and lithography. Electrostatic chucks offer advantages such as uniform wafer heating, minimal particle generation, and improved process control, making them essential components in semiconductor manufacturing equipment.

The major global manufacturers of Electrostatic Chuck include Applied Materials, Lam Research, SHINKO, TOTO, Sumitomo Osaka Cement, Creative Technology Corporation, Kyocera, Entegris, NTK CERATEC, NGK Insulators, Ltd., II-VI M Cubed, Tsukuba Seiko, Calitech, Beijing U-PRECISION TECH CO., LTD., etc. The global
