Research Summary

Electrosurgical cutting forceps, also known as electrosurgical forceps, are specialized surgical instruments used in electrosurgery, a medical technique that employs high-frequency electrical currents to cut and coagulate tissue during surgical procedures. These forceps are designed with an insulated handle and a pair of opposing metal jaws, one of which is active and delivers the electrical current while the other acts as a return electrode. When the forceps are applied to the targeted tissue, the electrical energy creates a controlled incision by rapidly heating and vaporizing the tissue. Electrosurgical cutting forceps allow surgeons to make precise cuts with minimal bleeding, contributing to reduced blood loss, shorter surgical times, and improved surgical outcomes in a variety of medical procedures.
