### Research Summary

An electrosurgical pencil, also known as an electrosurgical handpiece or electrocautery pencil, is a handheld medical instrument used in surgical procedures to deliver high-frequency electrical currents for cutting, coagulating, or ablating tissue. It consists of a pencil-like handle with a control button and an electrode tip, typically made of a metal alloy, which comes into contact with the targeted tissue. Surgeons can use the electrosurgical pencil to precisely apply electrical energy to the tissue, creating incisions, sealing blood vessels, or removing tissue with controlled precision. By adjusting the power settings and the mode of operation, they can achieve various surgical outcomes, making electrosurgical pencils versatile and essential tools in diverse surgical specialties, including general surgery, orthopedics, and dermatology.
