Research Summary

Elevators and escalators are vertical transportation systems commonly found in buildings, serving the crucial role of moving people and goods between different floors efficiently and safely. Elevators are enclosed cabins that travel vertically along a shaft, allowing passengers to access upper or lower levels with ease. They are essential in tall buildings and structures, providing a convenient and accessible means of transportation. Escalators, on the other hand, are inclined moving walkways with steps that transport individuals between different floors or levels in a continuous cycle. They are often used in locations with high foot traffic, such as shopping malls, airports, and metro stations, to facilitate the movement of large numbers of people. Both elevators and escalators enhance accessibility, convenience, and the overall functionality of modern buildings, contributing to improved mobility and efficiency for occupants and visitors.
