Research Summary

An endobronchial blocker is a medical device used in anesthesia and thoracic surgery to achieve one-lung ventilation (OLV) by selectively blocking a bronchus. It consists of a flexible catheter with an inflatable balloon at the tip, which is inserted through a standard endotracheal tube and positioned in the target bronchus under bronchoscope guidance. Once inflated, the balloon occludes airflow to the lung on the blocked side, allowing the other lung to be ventilated independently. Endobronchial blockers are commonly used in procedures such as lung resections, thoracic trauma management, and lung isolation in critically ill patients. They offer an alternative to double-lumen endotracheal tubes, especially in patients with difficult airways or requiring postoperative ventilation.

The major global manufacturers of Endobronchial Blocker include Teleflex, Cook Medical, PROACT Medical, NexGen Medical, Fuji Systems, Well Lead Medical, etc. The global players competition landscape in this report is divided into three tiers.
