Research Summary

Enteral stents are medical devices used to treat and manage obstructions or blockages in the gastrointestinal tract, typically in the esophagus, stomach, or small intestine. These stents are designed to maintain an open passage and facilitate the normal flow of food, fluids, and digestive juices through the affected area. They are often employed when individuals have strictures, tumors, or other conditions that impede the natural movement of substances in the gastrointestinal system. Enteral stents are typically inserted endoscopically, and they expand to keep the blocked or narrowed area open, relieving symptoms and allowing for improved nutrition and hydration. This minimally invasive approach can provide palliative care and help manage symptoms in patients who are not suitable candidates for surgical interventions.
