Research Summary

An epidural catheter is a thin, flexible tube that is inserted into the epidural space of the spine, which is the outermost part of the spinal canal. It is commonly used in medical procedures to provide epidural anesthesia or pain relief. Once in place, the epidural catheter allows healthcare providers to administer local anesthetics, opioids, or other pain-relieving medications directly to the nerves near the spinal cord, effectively blocking pain signals from reaching the brain. Epidural catheters are used in various medical contexts, including during childbirth to manage labor pain, in post-operative pain management, and for chronic pain relief. Their flexibility and precise placement make them valuable tools in providing targeted and continuous pain relief for patients undergoing surgery or experiencing significant pain.
