Research Summary

An epidural-flat filter is a specialized medical device used in epidural procedures to prevent the passage of air bubbles, bacteria, and particulate matter into the epidural space during drug administration. Designed with a flat, low-profile structure, it provides a high level of filtration—typically 0.2 microns—while maintaining a smooth and uninterrupted flow of medication. Its compact form helps minimize dead space and ensures close proximity to the patient, reducing the risk of contamination and backflow. This type of filter is commonly used in anesthesia and pain management to enhance safety and maintain sterility throughout the procedure.
