Research Summary

An esophageal temperature management system is a medical device used to monitor and regulate the temperature of the esophagus during medical procedures or in critical care settings. The system consists of a temperature probe that is inserted into the esophagus through the nose or mouth. This probe continuously measures the temperature of the esophageal tissue, providing accurate feedback to the medical team. The temperature management system can then adjust the temperature of fluids circulated through the esophageal probe, helping to maintain the patient's core body temperature within a desired range. This is particularly important during surgeries where maintaining stable body temperature is crucial, such as cardiac surgery or neurosurgery. Additionally, esophageal temperature management systems are used in critical care settings to manage fever, hypothermia, or hyperthermia in patients who are unable to regulate their own body temperature due to illness or injury. Overall, these systems play a vital role in improving patient outcomes and reducing the risk of complications related to temperature fluctuations during medical procedures.

The major global manufacturers of Esophageal Temperature Management System include Abbott, CIRCA Scientific, Japan Lifeline, Attune Medical, FIAB, VITAL Corporation, ICU Medical, Medtronic, Philips, GE Healthcare, J-Sol Medical, DeRoyal, Gentherm, Medline, Exsense Medical, MedLink Electronics, Novamed USA, etc. The global players competition landscape in this report is divided into three tiers.
