Research Summary

Esterquats, short for ?esterified quaternary ammonium compounds,? are a class of chemicals commonly used in the production of fabric softeners and hair care products, such as conditioners and hair detanglers. These compounds are known for their ability to impart a soft and smooth texture to fabrics and hair by reducing friction and static electricity. Esterquats are typically formed by esterification, which involves the reaction of a fatty acid with a quaternary ammonium compound. This chemical structure allows esterquats to adhere to fabrics or hair, providing a long-lasting softening effect. They are favored in consumer products due to their biodegradability and low environmental impact compared to some alternative softening agents, making them a popular choice for enhancing the feel and manageability of textiles and hair.

The major global manufacturers of Esterquats include Stepan Company, Kao Chemicals, Evonik Industries, BASF SE, Clariant Chemicals, Italmach Chemicals, LG, Chemelco International BV, Hony New Material, kori biological technology, etc. The global players competition landscape in this report is divided into three tiers.
