Research Summary

An Excimer Irradiation Unit is a specialized device that emits ultraviolet (UV) light, typically in the far-UV range, using excimer technology. It generates monochromatic, high-energy UV radiation through the excitation of rare gas or gas-halide molecules, which produce light when returning to their ground state. These units are widely used in medical, industrial, and scientific applications, including dermatology for treating skin conditions like psoriasis and vitiligo, sterilization of surfaces and air, and microfabrication in semiconductor manufacturing. Their precise wavelength control and ability to deliver high-intensity, non-thermal UV light make them effective for targeted applications with minimal damage to surrounding materials or tissues.

The major global manufacturers of Excimer Irradiation Unit include USHIO INC, ORC Manufacturing Co., Ltd., IST METZ GmbH & Co, Hamamatsu Photonics, GEW UV, Quark, TOSHIBA, M.D.COM.inc., SEJIN ONT Inc, SEN ENGINEERING, etc. The global players competition landscape in this report is divided into three tiers.
