Research Summary

Extracorporeal Membrane Oxygenation (ECMO) is a life-saving medical service used in critical care situations for patients with severe respiratory or cardiac failure. ECMO involves the use of a sophisticated machine that temporarily takes over the functions of the heart and lungs, allowing the patient's organs to rest and heal. During ECMO, blood is pumped outside the body through a membrane oxygenator, where it is oxygenated and carbon dioxide is removed before being returned to the patient's circulatory system. This process provides vital support for patients with conditions like acute respiratory distress syndrome (ARDS), heart failure, or congenital heart defects. ECMO is typically provided by specialized medical teams in dedicated ECMO centers or intensive care units and is used as a last-resort treatment when conventional therapies have been unsuccessful in stabilizing the patient's condition.
