Research Summary

An extremity tissue expander is a medical device used to gradually stretch and expand soft tissue in the arms or legs. Typically employed in reconstructive surgery, it consists of a silicone balloon-like implant placed beneath the skin and connected to a port. Over a period of several weeks to months, the expander is slowly filled with sterile saline solution through the port, causing the surrounding tissues to stretch and grow. This process allows for the creation of additional skin and soft tissue, often necessary in cases of traumatic injuries, congenital deformities, or cancer excisions, to achieve optimal functional and cosmetic outcomes during subsequent reconstructive procedures.
