Research Summary

Eyeglasses lenses monomer refers to the raw material used in the production of ophthalmic lenses, commonly known as eyeglasses lenses. Monomers are small molecules that polymerize to form polymers, which in turn create the lens material. In the case of eyeglasses lenses, the monomer undergoes polymerization to form a polymer called a resin, which is then processed into lenses. One of the most common monomers used in eyeglasses lens production is called 1.56 Index Monomer, a type of high-index plastic lens material known for its lightweight and thin profile. Other monomers used may include polycarbonate, Trivex, and other proprietary formulations. These monomers are chosen for their optical properties, durability, and suitability for specific lens types, such as single vision, bifocal, or progressive lenses. Eyeglasses lenses made from these monomers offer various features, including high optical clarity, impact resistance, and UV protection, catering to the diverse needs of eyeglass wearers.

The major global manufacturers of Eyeglasses Lenses Monomer include Mitsui
