Research Summary

Feed-grade vitamin D, specifically vitamin D3 (cholecalciferol), is a vital nutritional supplement used in animal nutrition to ensure proper calcium and phosphorus metabolism, bone health, and overall well-being of livestock and poultry. Vitamin D is essential for animals as it aids in the absorption and utilization of calcium and phosphorus from their diet, facilitating bone development and maintenance. In animal feed formulations, feed-grade vitamin D is added to help meet the dietary vitamin D requirements of animals, ensuring they receive the necessary levels for optimal growth, reproduction, and overall health. Adequate vitamin D supplementation in animal diets helps prevent conditions like rickets and osteomalacia, which can negatively impact bone and skeletal health, and contributes to improved animal performance and productivity.
