### Research Summary

A femoral arteriovenous cannula is a medical device used in vascular access for critically ill patients, particularly in the intensive care unit (ICU) or during certain medical procedures. It is a thin, flexible tube typically inserted into the femoral artery and vein in the groin area to provide a temporary route for the withdrawal of blood or the infusion of fluids, medications, or contrast agents. The femoral arteriovenous cannula is secured in place and allows healthcare professionals to monitor blood pressure, obtain blood samples, administer treatments, and perform medical procedures without the need for repeated needle sticks. This vascular access method is often used when central venous access is required quickly or when other access sites are unavailable or unsuitable.
