Research Summary

A femoral vein central venous catheter (CVC) is a medical device inserted into the femoral vein, located in the groin area, to provide access to the central venous system for various clinical purposes. This catheter is typically used for administering medications, fluids, and nutrients, as well as for measuring central venous pressure or for the collection of blood samples. It is often employed in emergency situations or when other venous access points, such as those in the arm or neck, are difficult to access. The femoral vein offers a relatively large, easily accessible vein for catheter insertion, but the procedure requires careful placement to avoid complications like infection, thrombosis, or injury to surrounding structures. The catheter may be temporary or long-term, depending on the patient's medical needs.
