Research Summary

A fermentation defoamer, often known as an antifoaming agent or antifoam, is a chemical additive used in fermentation processes to control and reduce the formation of foam or froth. During fermentation, particularly in biotechnological and industrial applications like brewing, fermentation of food products, or pharmaceutical production, the growth and activity of microorganisms can lead to the release of gases, creating foam that can disrupt the process by impeding mixing, reducing heat transfer, and potentially causing equipment overflow. Fermentation defoamers typically consist of surfactants, oils, or silicon-based compounds that are added to the fermenting mixture to break down and disperse foam bubbles, preventing excessive foaming and ensuring a more efficient and controlled fermentation process without negatively affecting the microorganisms or the final product quality.

The major global manufacturers of Fermentation Defoamer include DuPont, Momentive, Wacker, Shin-Etsu, PennWhite, KCC Basildon Chemicals, Blackburn Chemicals, Accepta, ADDAPT Chemicals, Emerald Performance Materials, Hydrite Chemical
