Research Summary

Ferrous slag, often referred to simply as slag, is a byproduct of the iron and steel manufacturing process. It consists of molten materials that are generated during the smelting or refining of iron ore to produce iron and steel. Ferrous slag primarily comprises silicate and oxide compounds, including iron, calcium, magnesium, aluminum, and other trace elements. After cooling, the molten slag solidifies into a glassy or crystalline material. Ferrous slag has various uses, such as in construction, where it can be employed as a building material, road aggregate, or cementitious material. It can also be utilized in the production of cement, as a raw material in the manufacturing of mineral wool insulation, and in applications related to soil stabilization and as a raw material in some industrial processes. Recycling and repurposing ferrous slag help reduce waste in the steel industry and contribute to sustainable resource management.

The major global manufacturers of Ferrous Slag include NSSMC, Levy, NLMK, ArcelorMittal, Evraz, Tata Steel, JFE, CRH, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading
