Research Summary

Fire retardant treated wood (FRTW) is a type of wood that has undergone a treatment process to enhance its resistance to ignition and slow down the spread of flames. This treatment involves the impregnation of the wood with fire-retardant chemicals under controlled conditions. Commonly used in construction, FRTW is employed in areas where building codes require specific fire ratings, such as interior wall assemblies, roofs, and other structural components. The treatment typically works by creating a char layer when exposed to fire, which acts as a barrier to limit the wood's involvement in combustion. Fire retardant treated wood is crucial for improving the fire safety of structures, providing additional time for evacuation and emergency response in the event of a fire. Regular testing and adherence to industry standards are essential to ensure the ongoing effectiveness of fire retardant treated wood in fire protection applications.

The major global manufacturers of Fire Retardant Treated Wood include Hoover Treated Wood Products, Lonza, Koppers, Foreco, FRCT, Viance, Allweather Wood,
