Research Summary

A Fischer-Tropsch catalyst is a material used to facilitate the Fischer-Tropsch process, which converts synthesis gas (a mixture of carbon monoxide and hydrogen) into liquid hydrocarbons such as synthetic fuels and chemicals. These catalysts typically consist of metals like iron, cobalt, or ruthenium, often supported on materials such as silica, alumina, or zeolites to enhance their performance and durability. Cobalt-based catalysts are particularly favored for their high activity and selectivity in producing long-chain hydrocarbons from natural gas-derived synthesis gas, while iron-based catalysts are commonly used for coal-derived synthesis gas due to their effectiveness in handling higher carbon monoxide concentrations. The Fischer-Tropsch catalysts are crucial in gas-to-liquid (GTL) and coal-to-liquid (CTL) technologies, enabling the production of cleaner-burning fuels and other valuable chemical products from various carbon sources.

The major global manufacturers of Fischer-Tropsch Catalyst include Sasol, Shell, Synfuels China, Hebei Xinpeng Chemical Industry, etc. The global players competition
