Research Summary

A flexible graphite bipolar plate is a key component in fuel cell technology, particularly proton exchange membrane (PEM) fuel cells. These plates serve as conductive and corrosion-resistant separators between individual cells within a fuel cell stack. Made from flexible graphite material, which is composed of layers of graphene sheets, these bipolar plates exhibit excellent thermal conductivity, mechanical flexibility, and chemical resistance. The flexibility of the graphite allows for uniform contact with the cell components, ensuring efficient electrical conductivity while accommodating the thermal expansion and contraction that occurs during the fuel cell operation. The bipolar plate's design is crucial for maintaining a balance between electrical performance and mechanical durability, contributing to the overall efficiency and reliability of fuel cell systems used in various applications, including transportation and stationary power generation.

The major global manufacturers of Flexible Graphite Bipolar Plate include Schunk, Ballard, SGL Carbon, Nisshinbo, Sinosynergy, Weihai Nanhai Carbon Materials Co,
