Research Summary

A Floating Storage and Regasification Unit (FSRU) is a specialized vessel used in the liquefied natural gas (LNG) industry for the processing and transfer of natural gas. FSRUs serve a dual purpose: they function as both a floating storage facility and a regasification terminal. These vessels are typically stationed near coastal areas, where they can receive LNG shipments from carriers, store the liquefied gas in onboard tanks, and then regasify it for delivery to onshore gas pipelines. FSRUs provide a flexible and cost-effective solution for regions lacking infrastructure for traditional onshore LNG terminals. Their mobility allows them to be relocated to different locations as needed, providing a rapid response to changing market demands or supply requirements. FSRUs play a crucial role in expanding the accessibility of natural gas to regions without fixed regasification infrastructure, contributing to the global energy supply chain.

The major global manufacturers of Floating Storage And Regasification Unit (FSRU) include Hyundai Heavy Industries, Daewoo Shipbuilding & Marine Engineering,
