Research Summary

Flotation reagents are chemical compounds used in the froth flotation process, a widely employed method in mineral processing to separate valuable minerals from gangue or waste material. These reagents play a critical role in modifying the surface properties of minerals, enhancing their hydrophobic or hydrophilic characteristics. Common types of flotation reagents include collectors, which selectively attach to mineral particles and facilitate their adherence to air bubbles, frothers, which stabilize the froth and improve bubble formation, and depressants, which inhibit the flotation of specific minerals. The proper selection and application of flotation reagents are crucial for optimizing the efficiency of the flotation process, improving mineral recovery, and achieving desired concentrate grades in industries such as mining and ore processing. The continuous development of new and specialized flotation reagents contributes to the advancement of mineral processing technologies and the extraction of valuable minerals from complex ore deposits.

The major global manufacturers of Flotation Reagents include AkzoNobel, Chevron
