### Research Summary

Flow Imaging Microscopy, also known as dynamic imaging, is an advanced microscopy technique that provides real-time, high-resolution imaging of particles or objects suspended in a fluid as they flow through a microfluidic channel. This method combines aspects of traditional microscopy with flow cytometry, allowing for the visualization and analysis of particles in motion. The system typically includes a flow cell where the sample is injected and passed through a detection zone. A high-speed camera captures images of individual particles as they move through the fluidic stream. Flow Imaging Microscopy enables the characterization of various particles, such as cells, microorganisms, or particles in colloidal suspensions, providing valuable information about size, shape, and concentration. This technique is widely used in fields like biotechnology, pharmaceuticals, and environmental science for applications ranging from cell analysis to quality control in manufacturing processes.

The major global manufacturers of Flow Imaging Microscopy/Dynamic Image include

Bio-Techne, Fluid Imaging Technologies, VERDER Group, Sysmex Corporation, Sympatec, Fritsch, Bettersize Instruments, Micromeritics, Occhio, etc. The global players competition landscape in this report is divided into three tiers.
