Research Summary

A Flue Gas Heat Exchanger (FGHE) is a device integrated into the exhaust flue of a combustion system, such as a boiler or furnace, to recover heat from the hot flue gases before they are released into the atmosphere. The heat exchanger extracts thermal energy from the flue gases and transfers it to a heat transfer fluid, typically water or air, which can then be used for space heating or other applications. This process enhances the overall energy efficiency of the system by capturing and utilizing heat that would otherwise be wasted. Flue gas heat exchangers are employed in residential, commercial, and industrial heating systems to improve energy conservation, reduce fuel consumption, and lower greenhouse gas emissions. They contribute to sustainable energy practices by recovering valuable thermal energy from the combustion process and maximizing the utilization of resources in heating applications.
