Research Summary

Fluorescence Lifetime Imaging Microscopy (FLIM) is an advanced microscopy technique that provides insights into the lifetimes of fluorescent molecules within a sample. Unlike traditional fluorescence microscopy, which captures the intensity of emitted light, FLIM measures the time a fluorophore takes to return to its ground state after excitation. This time, known as the fluorescence lifetime, is influenced by factors such as the local environment, molecular interactions, and fluorophore concentration. FLIM enables the visualization of dynamic molecular processes and can be used to study phenomena like protein-protein interactions, cellular metabolism, and intracellular signaling. By analyzing fluorescence lifetimes, researchers gain a deeper understanding of the microenvironment and molecular interactions within biological specimens, making FLIM a powerful tool in cell biology, biochemistry, and medical research.

The major global manufacturers of Fluorescence Lifetime Imaging Microscopy include Leica, Olympus, Zeiss, Becker & Hickl, HORIBA, PicoQuant, Bruker, Nikon, Jenlab,
