Research Summary

Fluoride varnish is a topical dental treatment used to prevent tooth decay and strengthen enamel. It is a concentrated fluoride product that is applied to the teeth by a dental professional. The varnish typically contains a high concentration of fluoride, usually in the form of sodium fluoride, which adheres to the tooth surface and slowly releases fluoride over time. The application of fluoride varnish is a quick and simple procedure, involving painting the varnish onto the teeth with a small brush. Once applied, the varnish dries quickly, forming a protective coating on the teeth. Fluoride varnish is effective in preventing tooth decay by promoting remineralization of the enamel, inhibiting the growth of bacteria, and reducing the risk of acid erosion. It is commonly used in pediatric dentistry and for individuals at higher risk of developing dental caries.
