Research Summary

A fluorine-lined globe valve is a type of valve designed to control the flow of corrosive fluids in industrial applications, particularly in the chemical, pharmaceutical, and semiconductor industries. The valve body is lined with a layer of fluoropolymer, such as polytetrafluoroethylene (PTFE) or perfluoroalkoxy (PFA), which provides excellent resistance to a wide range of aggressive chemicals, acids, and solvents. The globe valve design allows for precise regulation of fluid flow, making it ideal for applications where fine control is needed. The fluorine lining protects the valve's internal components from corrosion, extending the valve's lifespan and ensuring reliable performance in harsh environments. These valves are typically used in systems that handle toxic or reactive fluids, offering both safety and durability while minimizing the risk of contamination or equipment failure.
