### Research Summary

In the context of semiconductor manufacturing, flux refers to a material used in the soldering and bonding processes involved in the assembly of electronic components. Flux serves several crucial functions, including removing oxide layers from metal surfaces, promoting wetting for improved solder adhesion, and preventing oxidation during the soldering process. It helps facilitate the formation of reliable and robust electrical connections by ensuring proper solder flow and adhesion between the semiconductor components and the substrate or circuit board. The choice of flux in semiconductor applications is critical, as it must meet stringent requirements for purity to avoid contamination and interference with the delicate electronic components. Additionally, the flux must be compatible with the specific materials used in semiconductor manufacturing to ensure the overall reliability and performance of the electronic devices.

The major global manufacturers of Flux for Semiconductor include MacDermid (Alpha and Kester), SENJU METAL INDUSTRY, Asahi Chemical & Solder Industries, Henkel,
