Research Summary

Functional Near-Infrared Spectroscopy (fNIRS) is a non-invasive neuroimaging technique that measures changes in hemoglobin concentration in the brain, providing insights into cerebral blood flow and oxygenation levels. This system utilizes near-infrared light to penetrate the scalp and skull, reaching the brain tissue. Hemoglobin absorbs light differently when it is oxygenated or deoxygenated, allowing fNIRS to detect these changes and infer neuronal activity. fNIRS is particularly advantageous for studying brain function in natural environments, as it is portable, comfortable, and does not require cumbersome equipment. Researchers and clinicians use fNIRS to investigate various cognitive processes, such as attention, memory, and emotional responses, making it a valuable tool in neuroscience and clinical applications for understanding brain function and dysfunction.

The major global manufacturers of fNIRS Brain Imaging System include Hitachi, Shimadzu Corporation, Artinis, NIRx, OBELAB, Biopac, Huichuang Medical, Spectratech, Gowerlabs, etc. The global players competition landscape in this report is
