Research Summary

Foam dressing is a type of wound care product designed to manage and promote the healing of wounds. Composed of soft, absorbent materials, these dressings typically consist of layers of polyurethane or other foam-like substances. Foam dressings are highly absorbent and can effectively manage moderate to heavily exuding wounds by wicking away excess moisture and providing a moist wound healing environment. The dressing's structure allows for flexibility and conformability, making it suitable for various wound shapes and locations. Additionally, foam dressings may have a waterproof or semi-permeable outer layer to protect the wound from external contaminants while still allowing for gas exchange. They are commonly used for wounds such as pressure ulcers, surgical incisions, and traumatic injuries, offering a versatile and comfortable option in wound management.
