Research Summary

Foamed metal, also known as metal foam or metallic foam, is a unique material characterized by a cellular structure that resembles a sponge-like network. It is created by introducing gas or a foaming agent into molten metal, leading to the formation of bubbles that solidify within the metal matrix. This results in a lightweight yet robust material with a combination of properties not typically found in solid metals, including high strength, thermal conductivity, and sound absorption. Foamed metals can be produced from various metals such as aluminum, copper, and steel, and their applications span a range of industries. They are utilized in automotive components, aerospace structures, heat exchangers, and acoustic damping applications, taking advantage of their lightweight nature and unique combination of mechanical and thermal properties. Foamed metals have also garnered interest for their potential in energy absorption and impact resistance, making them valuable in areas such as crash safety and structural engineering.

The major global manufacturers of Foamed Metal include Hunan Corun, Yuantaida New Materials Co., Ltd., Sumitomo Electric Industries, Ai Lantian High-tech, Heze Tianyu
