Research Summary

Focused Ion Beam (FIB) is a sophisticated technique in materials science and micro/nanofabrication that employs a focused beam of ions, typically gallium ions, for precision milling, imaging, and analysis at the nanoscale. The instrument consists of a scanning electron microscope (SEM) coupled with an ion beam column. The primary applications of FIB include sample preparation for transmission electron microscopy (TEM), fabrication of microdevices, and three-dimensional nanoscale imaging. The focused ion beam can be used to selectively remove material from a sample by sputtering, allowing for the creation of intricate structures and the extraction of cross-sectional samples for detailed analysis. FIB is crucial in fields such as semiconductor technology, materials research, and nanotechnology, offering a powerful tool for manipulating and characterizing materials at the micro and nanoscale with exceptional precision.

The major global manufacturers of Focused Ion Beam (FIB) include Hitachi High-Technologies, FEI, Carl Zeiss, JEOL, TESCAN, etc. The global players competition
