### Research Summary

A forehead thermometer is a non-contact medical device designed to measure an individual's body temperature by scanning the temporal artery on the forehead. Utilizing infrared technology, these thermometers detect the heat emitted by the skin surface and convert it into an accurate temperature reading. This method is convenient and hygienic, as it doesn't require direct contact with the person being measured, reducing the risk of cross-contamination. Forehead thermometers have gained popularity for their ease of use, quick response time, and suitability for various age groups, making them particularly useful in situations where frequent temperature monitoring is necessary, such as in healthcare settings or for screening purposes during public health emergencies.
