Research Summary

Form in Place (FIP) gaskets are a type of sealing solution used in various industries, including automotive, electronics, and manufacturing. Unlike traditional pre-formed gaskets, FIP gaskets are created by dispensing a liquid gasket material directly onto a substrate or mating surface, where it then cures or solidifies in place. This process is often automated, using precision dispensing equipment to apply the gasket material in a controlled and uniform manner. FIP gaskets provide several advantages, including the ability to create customized gasket shapes, accommodate complex geometries, and achieve consistent seal quality. The materials used in FIP gaskets can vary, with options such as silicones, urethanes, or elastomers, selected based on the specific application requirements, including temperature resistance, chemical compatibility, and environmental conditions. FIP gaskets are widely used to create reliable and durable seals in electronic enclosures, automotive components, and other equipment where effective sealing is essential to prevent leaks and contamination.
