Research Summary

Fosthiazate is a chemical compound that belongs to the class of organophosphorus pesticides. It is commonly used as a nematicide, meaning it is employed to control nematode populations in agriculture. Nematodes are microscopic roundworms that can be harmful to plants by feeding on their roots, potentially causing damage and reducing crop yields. Fosthiazate works by inhibiting the nervous system of nematodes, leading to their paralysis and eventual death. This pesticide is particularly utilized in the cultivation of various crops, including potatoes, carrots, and onions, to protect the plants from nematode infestations. As with any pesticide, the application of fosthiazate is regulated to ensure its safe and effective use, and it is important for farmers to follow recommended guidelines for application and adhere to any relevant safety precautions to minimize environmental impact and potential risks to human health.

The major global manufacturers of Fosthiazate include ISK, Hebei Sannong Agricultural Chemical, Veyong, etc. The global players competition landscape in this report is divided into three tiers.
