Research Summary

FOUP (Front Opening Unified Pod) and FOSB (Front Opening Shipping Box) are standardized containers used in the semiconductor manufacturing industry to transport and store semiconductor wafers in a clean and controlled environment. FOUP is a pod designed to house multiple wafers, typically in a vertical orientation, and is used within semiconductor fabrication facilities to protect wafers from contamination during various manufacturing processes. FOUPs feature a front opening mechanism that allows automated equipment to access the wafers without exposing them to the surrounding environment. FOSB, on the other hand, is a larger container used for transporting FOUPs between different facilities or semiconductor manufacturing locations. FOSBs provide an additional layer of protection during transportation, ensuring that wafers remain clean and undamaged. Both FOUPs and FOSBs are critical components in the semiconductor industry's efforts to maintain high levels of cleanliness and precision in the production of integrated circuits and electronic components.

The major global manufacturers of FOUP and FOSB include Entegris, Shin-Etsu
