Research Summary

A Fourier-Transform Infrared (FTIR) spectrometer is a powerful analytical instrument used to study the interaction between matter and infrared light. It operates on the principle of interferometry, specifically Fourier transform spectroscopy. In an FTIR spectrometer, infrared light is directed through a sample, and the resulting spectrum is obtained by measuring the interference pattern when the sample interacts with the light. This spectrum provides valuable information about the molecular composition and structure of the sample. FTIR spectroscopy is widely used in various scientific and industrial applications, including chemistry, biology, environmental science, and material analysis. It enables researchers to identify functional groups, characterize chemical bonds, and analyze complex mixtures. The versatility and sensitivity of FTIR spectrometers make them indispensable tools in laboratories for qualitative and quantitative analysis of a wide range of substances.

The major global manufacturers of FTIR Spectrometer include Thermo Fisher, Perkin Elmer, Bruker, Agilent, Shimadzu, ABB, JASCO Corporation, MKS Instruments,
