Research Summary

A full-body scanner is an advanced security screening device designed to detect hidden objects or substances concealed on a person's body. Typically used in airport security and high-security facilities, these scanners employ various technologies such as millimeter-wave or backscatter X-ray imaging to create detailed, three-dimensional images of an individual's entire body. The scanner can reveal concealed items beneath clothing, helping security personnel identify potential threats such as weapons or prohibited items. Full-body scanners are designed with privacy considerations in mind, employing privacy filters and displaying generic avatars rather than detailed images of the scanned individual. While controversial due to privacy concerns, these scanners play a crucial role in enhancing security measures by providing non-intrusive and effective screening for concealed items during the security screening process.
