Research Summary

Full dentures, also known as complete dentures, are removable dental prosthetics designed to replace an entire set of missing teeth in either the upper or lower jaw. These prosthetic devices are typically made of acrylic or a combination of acrylic and metal, and they rest directly on the gums, relying on suction or adhesive for stability. Full dentures are custom-made to fit the individual's oral anatomy and are crafted to mimic the appearance and function of natural teeth. They serve both aesthetic and functional purposes, restoring the patient's ability to chew, speak, and maintain facial structure after the loss of all teeth in a dental arch. Advances in dental technology have led to improved materials and techniques for creating full dentures, providing patients with more comfortable and lifelike solutions for complete tooth replacement.
