Research Summary

A fully automatic immunohistochemical (IHC) stainer is an advanced laboratory instrument designed to automate the process of staining tissue samples for immunohistochemical analysis. This process involves applying specific antibodies to tissue sections to detect the presence and localization of particular antigens, aiding in the diagnosis and research of diseases such as cancer. The fully automatic IHC stainer streamlines the procedure by managing multiple steps, including deparaffinization, rehydration, antibody application, incubation, washing, and counterstaining, without manual intervention. This automation enhances consistency, reduces human error, increases throughput, and ensures high-quality and reproducible results, making it essential for pathology labs and research institutions seeking efficient and reliable diagnostic processes.
