Research Summary

Fumed silica powder is a finely divided, nanoscale form of amorphous silica that is produced through the pyrolysis of silicon compounds in a high-temperature flame. The resulting powder consists of aggregated nanoparticles with a high surface area, making it an exceptional additive with diverse applications. Fumed silica powder is prized for its unique properties, including a large surface area, high purity, and the ability to act as a thickening and reinforcing agent. In various industries, including coatings, adhesives, sealants, and polymers, fumed silica powder is used to improve rheological properties, enhance viscosity, and provide structural reinforcement. Its versatility also extends to applications in cosmetics, pharmaceuticals, and food products, where it functions as an anti-caking agent, viscosity modifier, or flow aid. The fine particle size and large surface area of fumed silica powder contribute to its effectiveness in modifying the physical and chemical properties of a wide range of materials.

The major global manufacturers of Fumed Silica Powder include Evonik, Cabot, Wacker, Tokuyama, Orisil, OCI Corporation, GBS, Wynca, Fushite, Changtai, Blackcat,
