Research Summary

Fumed silica, also known as pyrogenic silica, is a fine, white powder composed of nanoscale particles of amorphous silicon dioxide. It is produced by the high-temperature hydrolysis of silicon tetrachloride in a flame of hydrogen and air. The resulting silica particles form aggregates with high surface area and a unique three-dimensional structure. Fumed silica is valued for its versatility and is commonly used as a thickening and reinforcing agent in various industrial applications, including adhesives, sealants, coatings, and plastics. Due to its high surface area and excellent rheological properties, fumed silica can enhance the viscosity, stability, and performance of liquid formulations. It also finds use as a free-flow and anti-caking agent in powdered products. Fumed silica's ability to modify the rheological characteristics of materials makes it a valuable additive in industries ranging from pharmaceuticals to cosmetics, providing improved texture, stability, and performance to a wide range of products.

The major global manufacturers of Fumed Silica include Evonik, Cabot, Wacker, Tokuyama, Orisil, OCI Corporation, Wynca, GBS, Fushite, Blackcat, Changtai, etc. The global players competition landscape in this report is divided into three tiers. The first
