Research Summary

Fusing machines, in the context of textile and garment manufacturing, are industrial machines designed for the process of heat setting or fusing various components of fabric, such as interlinings or fusible interfacings, onto the main garment fabric. These machines use heat and pressure to bond the layers together, creating a durable and cohesive textile structure. Fusing machines play a critical role in enhancing the quality and performance of garments by ensuring proper adhesion of interfacing materials. They are commonly used in the production of tailored clothing, shirts, jackets, and other garments where a specific level of stiffness or reinforcement is desired. The fusing process involves passing the fabric through heated rollers, activating the adhesive on the interfacing material and bonding it securely to the main fabric. Fusing machines contribute to the efficiency and consistency of garment manufacturing, enabling the production of high-quality and well-structured textiles.

The major global manufacturers of Fusing Machines include Veit Group, Meyer, Maica Italia, HASHIMA, Oshima, Shanghai Weishi Machinery, Rotondi Group, Reliant
