Research Summary

Gamma-aminobutyric acid, or GABA, is a neurotransmitter in the brain that plays a crucial role in regulating neuronal excitability throughout the nervous system. As an inhibitory neurotransmitter, GABA works to reduce the activity of neurons, helping to balance and control brain activity. It achieves this by binding to specific receptors, known as GABA receptors, on the surface of neurons, which leads to the opening of ion channels that decrease the likelihood of an action potential, or electrical signal, being generated in the postsynaptic neuron. GABA is involved in various physiological processes, including motor control, cognition, and the regulation of anxiety. Imbalances in GABA levels have been linked to conditions such as anxiety disorders, epilepsy, and insomnia. GABAergic drugs, such as benzodiazepines and barbiturates, are used clinically to modulate GABA activity and treat conditions such as anxiety, seizures, and sleep disorders.

The major global manufacturers of GABA (?-aminobutyric acid) include Pharma Foods International, Kyowa Hakko, Sekisui Chemical, Zhejiang YiWan Biolabs, Shanghai
