Research Summary

Gamma-aminobutyric acid, commonly known as GABA, is a neurotransmitter that plays a crucial role in regulating brain activity by inhibiting nerve transmission. It is an amino acid that acts as an inhibitory neurotransmitter in the central nervous system, calming overexcited nerve signals and promoting a state of relaxation. GABA receptors are widely distributed in the brain and are involved in various physiological functions, including anxiety regulation, stress response, and sleep cycles. While GABA is naturally produced in the brain, it is also available as a dietary supplement. Some people use GABA supplements to potentially alleviate stress, anxiety, and promote better sleep, although the effectiveness of such supplements is a subject of ongoing research. GABA's role in maintaining the balance between excitation and inhibition in the brain makes it a crucial component in the complex network of neurotransmitters influencing mental well-being.
