Research Summary

Gantry or Cartesian robots are a type of industrial robot designed with a linear coordinate system, typically utilizing three perpendicular axes (X, Y, and Z) to control movement along a flat, rectangular workspace. These robots are named for their resemblance to gantry cranes, featuring a horizontal overhead structure that supports and guides the movement of the robotic arm or tool. Gantry robots are well-suited for applications that require precise and repeatable movements along defined paths within a specific plane, making them widely used in manufacturing, assembly, material handling, and packaging processes. The linear design simplifies programming and control, and the robots can handle heavy loads with stability and accuracy. Gantry robots are versatile and find application in various industries due to their ability to perform tasks such as pick-and-place operations, machining, and other automation processes with efficiency and reliability.

The major global manufacturers of Gantry/Cartesian Robots include Gudel AG, IAI, Parker, Fibro, BAHR, BOSCH Rexroth, PROMOT, Martin Lord, YAMAHA, MOTEC,
