Research Summary

Garnet is a group of silicate minerals that share a common crystal structure but can vary in composition. This mineral group is widely recognized for its striking colors, which include red, green, orange, yellow, and brown, among others. The most common variety, known as almandine garnet, often displays deep red hues. Garnets are commonly used as gemstones in jewelry due to their beauty and durability. Beyond their ornamental use, garnets also find industrial applications as abrasive materials in sandblasting and waterjet cutting, owing to their hardness and resistance to wear. Garnets are typically formed in metamorphic rocks and some igneous rocks, and their diverse range of colors and properties make them valuable and versatile in both decorative and industrial contexts.

The major global manufacturers of Garnet include GMA Garnet, Indian Ocean Garnet Sands Company, Barton International, Opta Minerals, V.V.
