Research Summary

Gas Chromatography (GC) and Liquid Chromatography (LC) are both chromatographic techniques used for separating and analyzing complex mixtures. In GC, a gaseous mobile phase carries the sample through a stationary phase, separating components based on their interactions with the stationary phase. LC, on the other hand, employs a liquid mobile phase to move the sample through a stationary phase. Both techniques are widely used in analytical chemistry for applications such as identifying and quantifying compounds in a mixture. Gas Chromatography-Mass Spectrometry (GC-MS) and Liquid Chromatography-Mass Spectrometry (LC-MS) combine chromatography with mass spectrometry for compound identification, providing additional information about the molecular structure of separated compounds. Solid

Phase Extraction (SPE) apparatus is a sample preparation technique often used in chromatography. In SPE, a solid sorbent is used to selectively extract and concentrate analytes from a liquid sample. The SPE apparatus typically consists of a cartridge or column packed with a solid sorbent material. The sample is passed through the sorbent, retaining the analytes while unwanted substances are washed away. After elution, the concentrated analytes can be further analyzed using chromatographic techniques. SPE is valuable for sample cleanup and pre-concentration, enhancing the sensitivity and accuracy of chromatographic analyses.
